Hundreds of cows fall victim to radiation from power lines, mobile masts, wind turbines

Original Swedish title: Hundratals kor offer för strålning från kraftledningar, mobilmaster, vindkraftverk

In France, more than 50 farmers have been affected by abnormal mortality and morbidity, mainly among cows. The cause is suspected to be increased radiation in ground, air and water caused by power lines, mobile masts, wind turbines, solar cells and transformers that generate unnaturally elevated levels of harmful electromagnetic radiation in air, ground and in water.

One of the farmers affected is [Stéphane Le Béhec](#) from the Côtes-d'Armor region. He has lost 250 cows and calves in just 4.5 years. Significantly increased radiation in the ground and in the water has been measured in the yard. After more than four years of research into the cause, he is today convinced that the radiation from two mobile masts, a power line, wind turbines in the neighborhood and solar cells are the cause of the mass death and the deteriorating health among the animals. This [video](#) shows the two mobile masts and the power line that is suspected of contributing to the suffering.

The animals drink abnormally little water and milk far below normal. The causes of death include heart attacks, strokes and bleeding. The animals exhibit abnormal behavior, abnormally low body temperature (36 degrees instead of 38), urinary tract infections and Stéphane Le Béhec has also noted that both birds and insects have disappeared.

A video that you can see [here](#) shows sick cows and calves and we warn sensitive to very unpleasant pictures. However, Stéphane Le Béchet wants everyone to see the video, even if it is shocking. - This is my everyday life, he says. He appeals for help and that everyone should share the [video](#).

Blind calves

30 kilometers from Stéphane, Patrick Le Néchet runs a farm and he tells the newspaper [Le Parisien](#) about the tragedies that happened to his animals due to increased radiation. In five years, 120 animals have died:

"We have got blind calves with holes in the skull, with deformities and calves that just stand and spin around and hit their heads in the wall. Many animals are not able to get up lower and the cows produce very small amounts of milk. They stop drinking."

The vet has no explanation but a geobiologist has discovered elevated electric fields in the water. Patrick Le Néchet points out, among other things, a photovoltaic system at a neighbor's.

Geobiologist: Mobile masts scatter ground radiation

Geobilologist [Olivier Ranchy](#) is of the opinion that mobile masts can spread radiation from a facility in a larger area of land if there is a water vein under the mast. Via the water in the ground, radiation is spread to nearby farms and pastures.

The Association of Affected Animal Owners (L'ANAST, Association Nationale Animaux Sous Tension) conducts [legal proceedings](#) to administer justice to the affected farmers. It includes 57 affected animal owners and has hired the lawyer François Lafforgue, known for having sued asbestos and other environmental pollutants and also mobile masts. To the newspaper Le Monde, Lafforge says that the argument that health effects due to exposure to electromagnetic radiation would be due to concerns falls flat when it comes to cows.

At the end of 2019, a report was submitted to the court from a dozen farmers who complained about "trouble anormal du voisinage". The counterparties are telecom operators (mobile masts) and energy companies (power lines).

Wind turbines

Animal breeders in France have also noted a serious deterioration in the health of the animals on the farms that have received wind turbines in the immediate area. In addition to harmful infrared noise, the power lines that connect the wind turbines to the rest of the electricity grid are suspected of spreading dirty electricity.

According to [David Stetzer](#), an expert on dirty electricity, wind turbines create high levels of dirty electricity (dirty electricity) and also ground radiation, ie harmful electric fields are

spread in the ground just as can be the case from mobile masts.

[Researcher Magda Havas](#) says that cows near wind farms are often seen lifting their feet to avoid the radiation passing through their bodies. The electricity goes up through, for example, the front legs through the body and down through the hind legs. There is also an increased incidence of malformations or that cows and other animals have miscarriages.

According to Havas, the most serious effects of wind turbines are that the turbines generate both audible and inaudible noise (so-called infrared noise) which is harmful to health and the environment. Havas also points out that wind turbines also cause dirty electricity and ground radiation in the immediate area.

As early as 2009, [Discover Magazine](#) reported on an animal breeder in Taiwan who lost 400 goats and suspected a group of wind turbines of the deaths. The animal owner noticed that after 8 wind turbines were set up in the immediate area, the animals began to have poorer health, they ate worse, lost weight and many began to die.

In fact, there are [reports from around the world](#) of deteriorating health and mortality and malformations among animals living near wind turbines. [An article from Australia](#) back in 2012 tells of malformed lambs, human health problems and killed eagles (due to the spinning huge rotor blades).

This with the harmful environmental impact of wind turbines, mobile masts and solar cells seems to be developing into another gigantic environmental scandal given a massive ongoing expansion of mobile masts, wind turbines, photovoltaic facilities without objective investigations into and consideration of existing serious reports on environmental and health impact.
